

# WEEK 5 | SPEED

Four sessions of 60 minutes. All IDs continue into the Answer Book and Error Tracker.

Use the shorter decision limits shown. Flag uncertainty and continue; return only with a reason to change an answer. A rapid first pass must still read qualifiers carefully.

### W5D3-E02 | A STATION CLOCK AND A MISSED CONNECTION | 14 min

Match seven paragraphs to seven of the eight headings. Use each selected heading once; one is extra.

A. A deliberately less complete display

B. The apparently obvious explanation

C. A proposal to remove all timetables

D. The investigation changes its question

E. Testing under an unusual condition

F. Trust includes the admission of uncertainty

G. Two displays represent different moments

H. An unnoticed cue loses its meaning

1. When a passenger missed her connection, she blamed the station clock. It showed 10:12 as her train departed, although the timetable listed 10:14. The station team initially treated the complaint as a faulty-clock report. A recording from the platform camera complicated that explanation: the train had left at the correct time.

2. The large clock was accurate. The passenger had photographed an information screen displaying the time at which its connection to the network had stopped. Unlike the clock, this smaller display had frozen. Its familiar appearance made it seem current even after the information had ceased to update.

3. A tiny warning symbol had appeared in one corner of the screen. Staff who maintained the system recognised it immediately; passengers did not. The symbol had been designed to identify a technical condition, not to explain what that condition meant for someone deciding whether there was time to buy coffee.

4. Engineers could repair the network fault, but the design team asked a broader question: how should a screen behave when it can no longer confirm its information? Preserving the last display looked tidy. Replacing it with an explicit warning would be less elegant but would stop outdated data looking authoritative.

5. The revised design removed departure estimates when the connection failed and directed passengers to the staffed desk. This reduced the quantity of information on screen. It increased its honesty. The designers accepted that a visible gap was preferable to a confident answer that the system could no longer support.

6. The team simulated a connection failure during a quiet period and observed whether passengers noticed the warning. Testing only normal operation would have missed the original problem. The useful question was not whether people liked the screen, but whether their behaviour changed when its information became unreliable.

7. The incident shows why a service should reveal the limits of what it knows. A blank estimate can be frustrating, yet it allows a traveller to seek another source. An apparently precise estimate removes that incentive. Accuracy therefore depends partly on communicating when accuracy cannot be guaranteed.
